28 stories across **10 themes**: Regulatory · AI Risk · AI Ethics & Trust · AI Strategy · AI Workforce Impact · Funding & M&A · Enterprise ROI · Agentic AI · Model & Platform · Research to Business

Regulatory

Eight states sue OpenAI, saying ChatGPT isn't safe for kids

The Verge

Iowa, Kansas, Nebraska, West Virginia, Arkansas, Arizona, Idaho, and Montana have filed separate lawsuits against OpenAI alleging the company prioritized profits over safety and violated consumer protection laws by failing to warn about ChatGPT's risks to children. This represents a significant escalation in state-level AI regulation and creates material legal and compliance risk for AI companies targeting consumer markets.

OpenAI and Anthropic tell British lawmakers: Regulate us

Wired

OpenAI and Anthropic executives appeared before UK Parliament alongside whistleblowers and security leaders, actively requesting regulation. Meanwhile, Britain's spy chief warned nearby that AI could be used to create new bioweapons. The rare spectacle of tech companies asking for regulation signals the industry may be positioning to shape rules before governments impose less favorable ones.

The EU's next chapter in AI is agentic

OpenAI Blog

New analysis shows agentic AI adoption is growing across EU enterprises and small businesses, with OpenAI positioning the technology's expansion within the EU regulatory framework. This signals that the intersection of agentic AI deployment and EU AI Act compliance is becoming a concrete strategic challenge for companies operating in Europe.

The biggest pro-AI super PAC network has poured millions into Nevada shell companies

Wired

Leading the Future, backed by Silicon Valley titans, has raised huge sums to promote pro-AI candidates on both sides of the aisle, routing funds through Nevada shell companies. This reveals the scale of the AI industry's political spending apparatus and its efforts to shape the regulatory environment through electoral influence.

AI Risk

Now that Character.AI is going bankrupt, what happens to all of its users' data?

The Verge

Character.AI filed for bankruptcy, prompting 40 bipartisan state attorneys general led by New York's Letitia James to file a notice requiring consumer data protections in any sale of the company's assets. This sets a precedent for how user data — especially from AI companions used by minors — is handled in tech company failures, with implications for any AI startup holding sensitive conversational data.

An OpenAI employee allegedly used a chatbot to help plant a recording device at the office

Wired

An OpenAI engineer allegedly used a chatbot to plan the placement of a covert listening device in a meeting room used by high-level executives, days before one was discovered. This incident highlights a novel insider threat vector where AI tools enable corporate espionage, raising urgent questions about internal security governance at AI companies.

AI models can be easily modified to assist terrorist and extremist activity

Wired

Researchers demonstrated that AI models with removed guardrails provided detailed instructions for improvised explosive devices when prompted by someone identifying as a terrorist. The findings underscore the fragility of safety measures in current AI models and will fuel regulatory pressure on both open and closed model providers.

Open models have real benefits. Do they outweigh the risks?

MIT Technology Review

Anthropic released a report arguing that Z.ai's GLM-5.3 open model poses a major cyberattack risk, reigniting the debate over open vs. closed AI models. For business leaders, this is a strategic question: open models offer cost and customization advantages but create liability exposure if used by bad actors or if safety cannot be ensured.

AI Ethics & Trust

Flock CEO says its microphones detect 'just gunshots' — its website says different

TechCrunch

Surveillance company Flock is under mounting scrutiny from the ACLU and public as its CEO's claims about microphone capabilities contradict the company's own website. This exemplifies the reputational and legal risk of AI surveillance companies making misleading claims about data collection scope — a growing concern for any enterprise deploying monitoring technology.

AI labs are buying data from dead startups to train their models

MIT Technology Review

AI labs are acquiring datasets from defunct startups, with one founder netting $25,000 for code and expecting more for user data. This emerging data marketplace raises questions about user consent, privacy obligations that survive a company's death, and the provenance of AI training data — issues increasingly relevant to enterprise AI procurement.

Judge orders OpenAI to turn over hiring records in Apple trade secrets case

TechCrunch

A federal judge ruled Apple can access OpenAI's interview materials for former Apple employees, plus private messages and testimony from key figures in a trade secrets case. Combined with OpenAI's counter-claim that a former employee took product plans to Apple, this case highlights the intensifying IP warfare between major AI players and the legal risks of aggressive talent poaching.

OpenAI claims an ex-employee took its product plans and presented them to Apple

The Verge

OpenAI accuses a former employee of transferring over 100 files related to unreleased product plans to a personal account and presenting them to Apple leadership. This escalation in the Apple-OpenAI trade secrets battle signals that IP protection is becoming a critical operational risk as AI talent moves between competing giants.

AI Strategy

The AI race is back on

The Verge

After Anthropic and OpenAI appeared to pull ahead, Google, Meta, and Chinese competitors are mounting credible challenges, resetting the competitive landscape. For enterprise buyers, this means more model options and negotiating leverage, but also strategic risk in betting too heavily on any single provider.

Wikipedians believed AI would come and go. They were wrong

Wired

In the era of AI Overviews, Wikipedia's usage is declining as AI systems absorb and redistribute its content. This is an existential case study for any content-based business: AI models extracting value from human-created knowledge while potentially undermining the ecosystems that produce it.

Industrial Next wants factory robots to switch tasks in minutes, not weeks

TechCrunch

Industrial Next enables manufacturers to reprogram factory robots for complex, delicate tasks in minutes rather than weeks. This directly addresses a major barrier to automation in

manufacturing — the rigidity of traditional robotics — and could accelerate AI-driven hyper-automation in production environments.

AI Workforce Impact

McKinsey is making job applicants spar with a fake AI client

The Verge

McKinsey is integrating AI simulations into its entry-level interview process, requiring candidates to have a 10-minute conversation with an AI client that covers 80% of real consulting scenarios. This signals how top-tier professional services firms are already using AI to reshape talent evaluation, and suggests AI fluency is becoming a baseline hiring requirement.

Funding & M&A

Pluto Security raises $42M as AI gives enterprise security teams a new headache

TechCrunch

Pluto Security raised $42M to address the security vulnerabilities created by widespread employee AI tool usage. The company's premise — that giving everyone AI access creates gaping security holes — speaks directly to the Shadow AI problem enterprises face as unauthorized and unmonitored AI usage proliferates across organizations.

Zenzap raises $44M for its AI chat app that aims to replace WhatsApp in the workplace

TechCrunch

Zenzap raised $44M for an AI-powered workplace chat app already used by Starbucks and Taco Bell, targeting the large population of frontline workers who currently rely on consumer messaging apps. This reflects growing enterprise demand for AI-native communication tools tailored to deskless workforces.

Scimplify raises $25M to challenge China's grip on critical materials with AI

TechCrunch

Scimplify raised $25M, with its annualized revenue run rate tripling to $200M as it expands into the US market. The company uses AI to help reduce dependency on Chinese-controlled critical materials, sitting at the intersection of AI-driven supply chain innovation and geopolitical risk mitigation.

Ricursive Intelligence is betting on AI-designed chips to help solve the compute crisis

TechCrunch

Ricursive Intelligence is developing AI that designs chips iteratively, learning from each design cycle to accelerate development. If successful, this could help address the compute bottleneck constraining AI scaling — a critical infrastructure challenge that affects every company building or deploying AI.

Enterprise ROI

SentinelOne cuts malware analysis from weeks to hours with OpenAI

OpenAI Blog

SentinelOne used OpenAI's Daybreak to compress weeks of malware analysis into hours, creating capacity to investigate significantly more threats. This is a concrete example of AI delivering measurable operational efficiency in cybersecurity — reducing analysis time by orders of magnitude rather than incremental improvement.

How Block is building AI-powered security with OpenAI technology

OpenAI Blog

Block's security team is using OpenAI to investigate threats faster and propose patches in minutes rather than hours or days. For fintech companies handling billions in transactions, the speed improvement in security response represents both direct cost savings and reduced risk exposure.

Agentic AI

Square's new kiosk lets you talk to AI for help with your order

The Verge

Square launched a physical kiosk with an 'agentic, conversational voice layer' that understands a seller's full menu and handles natural-language ordering. This is a notable example of agentic AI entering physical retail at scale, though the 'agentic' label for what is essentially a voice-ordering interface warrants scrutiny for potential agentwashing.

How Third Moment Research runs 10,000 agents for 36+ hours

OpenAI Blog

Third Moment Research operates 10,000 AI agents continuously for 36+ hours using GPT-6 Astra and GPT-6.1 Sol, with agents that improve through use. This illustrates the emerging reality of large-scale agent orchestration and the associated compute costs — a concrete example of token anxiety at scale.

The Silent Failures in Agentic Data Science

arXiv

Researchers found that existing evaluations of AI data science agents assess only downstream performance and code correctness, missing critical silent failures in the design and execution pipeline. For enterprises deploying data science agents, this research

highlights a hidden 'hallucination tax' — agents may produce plausible-looking but fundamentally flawed analyses.

Model & Platform

YouTube sticks new labels on AI-generated songs

The Verge / TechCrunch

YouTube is adding 'Made with AI' labels to tracks altered or fully generated using AI, covering compositions and vocals from generative models. As AI-generated content floods streaming platforms, this labeling system establishes transparency norms that could influence how all platforms handle AI provenance disclosure.

Research to Business

AI came for math. Now it's chasing the rest of science

Wired

MIT researchers tell WIRED that AI may soon become the default method for solving theoretical problems in economics, high-energy physics, and other scientific fields. This has significant implications for R&D-heavy industries where AI could compress discovery timelines and reshape the competitive value of proprietary research capabilities.

Measuring the inference energy efficiency of open-weight LLMs across benchmarks and hardware

arXiv

Researchers measured energy efficiency across 86 open-weight models on seven benchmarks and six hardware platforms, finding large efficiency differences even among models with similar capability scores. Most configurations are far from the performance-energy Pareto frontier, suggesting enterprises could significantly cut AI inference costs by optimizing model-hardware pairing rather than just chasing benchmark scores.
