Funding & M&A

Disney Agrees to Hire the Majority of Character.AI's Workforce

TechCrunch

Disney is acquiring most of Character.AI's employees through a stalking horse bid in what appears to be a bankruptcy proceeding, with the vast majority of Character.AI staff accepting Disney's offers. This signals Disney's aggressive push into conversational AI capabilities and represents a significant talent acquisition in the AI space. Other bidders could still emerge with higher offers.

AI Stocks Plunge. Inflation Heats Up. Where We're Still Finding Opportunities

CNBC

AI stocks experienced a significant selloff last week, rattling markets as investors question valuations amid rising inflation. The rotation away from AI tech stocks toward other sectors like banking suggests growing investor skepticism about near-term AI revenue realization, even as long-term conviction remains.

Some Investors Are Questioning the AI Trade. Microsoft Is Bucking the Trend

The Motley Fool

While many AI stocks are under pressure from investor skepticism, Microsoft is maintaining its position as investors see its enterprise AI monetization strategy — through Azure, Copilot, and OpenAI integration — as more credible than peers. This widening gap between AI winners and the rest illustrates the AI Value Gap playing out in public markets.

Bending Spoons Gets Big Vote of Confidence from Berkshire Hathaway

CNBC

Berkshire Hathaway has invested in Bending Spoons, the software consolidator that acquires and revitalizes underperforming software companies, less than four months after its IPO. Warren Buffett's backing signals institutional validation of the roll-up strategy in an era where AI is reshaping which software companies can survive independently.

AI Ethics & Trust

Anthropic Says It's Committing 5% of Its Shares to a 'Public Benefit Fund'

TechCrunch

Anthropic is pledging 5% of its shares to a public benefit fund, a notable governance move for one of the most valuable AI companies. This sets a precedent for how frontier AI labs structure public accountability into their corporate frameworks, and could influence expectations for other AI companies approaching IPO or major funding rounds.

Who Is Responsible When AI Causes Harm?

Stanford HAI

Stanford HAI tackles one of AI policy's hardest unsolved problems: liability when AI systems cause harm. With AI agents increasingly making autonomous decisions in healthcare, finance, and legal contexts, the absence of clear liability frameworks creates material risk for enterprises deploying these systems — and potential exposure for boards and officers.

Regulatory

Anthropic Proposes AI Safety Bill Giving US Government Power to Block High-Risk Models

PYMNTS.com

Anthropic is proposing federal legislation that would give the US government authority to block deployment of high-risk AI models, a remarkable move from a leading AI developer advocating for its own regulation. This could reshape the US regulatory landscape, which has largely relied on voluntary commitments rather than binding government powers over frontier AI systems.

China Considers Export Controls on AI, Chips

Semafor

China is considering imposing its own export controls on AI technology and chips, a significant escalation in the US-China tech rivalry. This potential tit-for-tat move could further bifurcate global AI supply chains and force multinational companies to choose sides or duplicate infrastructure across geopolitical blocs.

OpenAI Backs AI Incident Reporting Rules but Leaves Timelines to Governments

Computer Weekly

OpenAI is supporting mandatory AI incident reporting requirements but is strategically leaving enforcement timelines to individual governments. This positions OpenAI to appear safety-conscious while avoiding binding commitments, a move that enterprise customers and regulators should watch closely as it may shape the compliance landscape.

Europe's CEOs Secured Extra Time on AI Rules. Now It's Up to HR to Use It Wisely

HR Executive

European CEOs have won additional time to comply with the EU AI Act, shifting the compliance burden to HR departments who must now operationalize AI governance in hiring, performance management, and workforce decisions. This delay creates a window for companies to build compliance infrastructure but also raises the risk of rushed implementation closer to deadlines.

Enterprise ROI

Companies Are Realizing They're Spending a Fortune on AI Just So Their Employees Can Generate Error-Riddled Slop, and Suddenly Cutting Back Budgets

Futurism

Companies are cutting AI budgets after discovering employees are using expensive AI tools primarily to generate low-quality, error-filled content rather than driving meaningful productivity gains. This is a textbook example of the GenAI Paradox and Hallucination Tax — broad adoption without measurable ROI, plus hidden costs from correcting AI-generated errors at scale.

36, 85, 14: Three Numbers That Explain the Enterprise AI Gap

CIO

CIO quantifies the enterprise AI gap with three stark metrics that likely illustrate the chasm between AI ambition and execution. This data-driven framing of the AI Value Gap is essential reading for leaders trying to understand where their organization stands relative to peers and what separates AI winners from the rest.

AI Strategy

Some Companies Give AI to Everyone. This CEO Is Doing the Opposite

CNBC

Paysend CEO Ben Chisell is restricting AI tools to top performers rather than rolling them out company-wide, a contrarian approach to enterprise AI deployment. This strategy challenges the prevailing 'democratize AI' narrative and raises important questions about whether concentrating AI access among high performers creates more value than broad adoption.

JPMorganChase Builds Enterprise AI Platform to Transform Everyday Tasks

The Digital Banker

JPMorgan Chase is building an enterprise-wide AI platform aimed at automating routine tasks across the bank, one of the most significant deployments in financial services. Given JPMorgan's scale — over 300,000 employees — this platform could set the benchmark for how large financial institutions operationalize AI beyond isolated use cases.

AI Bubble Fears Sweep Tech, Boosting Open-Weight AI

디지털투데이

Growing fears of an AI bubble are driving increased enterprise interest in open-weight AI models as companies seek to reduce dependency on expensive proprietary APIs. This shift could reshape the competitive landscape: if enterprises move to self-hosted open models, it undermines the revenue models of closed-source AI providers and reduces Token Anxiety around API costs.

The New Layer in Nvidia's Enterprise AI Strategy

Medium

Nvidia is adding a new strategic layer to its enterprise AI offerings, moving beyond chip sales to capture more of the AI infrastructure value chain. For enterprise buyers, this evolution means Nvidia is increasingly competing with cloud providers and software platforms, not just supplying them.

Palantir Evolves into Enterprise, Sovereign AI Operating System as Valuation Weighs

TokenPost

Palantir is positioning itself as an AI operating system for both enterprise and sovereign government clients, though its stretched valuation is drawing investor scrutiny. The company's dual enterprise-government strategy is a unique competitive position in the AI platform wars, but the market is questioning whether the stock price has outrun actual revenue growth.

Your Chatbot Will Define Your Brand

Harvard Business Review

HBR argues that as conversational AI interfaces become the primary customer touchpoint, the design of chatbot interactions becomes a strategic brand decision rather than a technical one. Companies that treat chatbot personality, tone, and relationship design as afterthoughts risk brand damage at scale.

Agentic AI

Enterprise AI Agent Control: OpenAI, Google, Workday Bets

Forbes

Forbes examines how OpenAI, Google, and Workday are competing for control of the enterprise AI agent layer, a strategic battleground that will determine which platform becomes the operating system for autonomous business workflows. The stakes are enormous: whoever controls enterprise agent orchestration will own a critical choke point in the AI value chain.

ServiceNow Plans AI Passport for Enterprise Agents

finchannel

ServiceNow is developing an 'AI Passport' system to provide identity, governance, and access control for enterprise AI agents — a critical infrastructure need as organizations deploy multiple autonomous agents. This addresses a growing pain point: as agent sprawl increases, companies need standardized ways to track, authenticate, and govern what AI agents can do.

Sam Altman's World Debuts ID Verification for AI Agents

PYMNTS.com

Sam Altman's World (formerly Worldcoin) is launching identity verification for AI agents, addressing the emerging need to distinguish between human and AI actors in digital transactions. As agentic AI proliferates, identity infrastructure for autonomous systems becomes a critical layer — this could become foundational plumbing for agent-to-agent commerce.

Beyond Workflow Automation: Agentic AI Readiness

FTI Consulting

FTI Consulting outlines an enterprise readiness framework for agentic AI that goes beyond simple workflow automation, addressing organizational, governance, and infrastructure prerequisites. This is relevant for executives trying to move from pilot agentic projects to scaled deployments — a transition where most companies are currently stuck.

Who Owns the Customer in the Age of AI Agents?

Harvard Business Review

HBR examines how AI agents acting on behalf of consumers are disrupting traditional customer relationships — when shoppers delegate purchasing decisions to AI, brand engagement no longer guarantees strategic control. This is a fundamental shift for marketing, sales, and CRM strategies: companies must now optimize for AI agent preferences, not just human ones.

AI Risk

Always On, Always Listening: New AI Devices Are Pushing Legal Limits

CNBC

Always-listening AI wearables from Apple, Amazon, Meta, and startups are testing the boundaries of wiretap and privacy laws, creating significant legal exposure for both manufacturers and enterprise users. Companies deploying these devices in workplaces could face litigation under state wiretapping statutes that were never designed for ambient AI recording.

AI Risks Put Enterprise Resilience to the Test in 2027

BankInfoSecurity

Enterprise resilience frameworks are being stress-tested by AI-specific risks heading into 2027, including model failures, supply chain dependencies on AI providers, and adversarial

attacks. Security leaders need to incorporate AI-specific scenarios into business continuity planning, a gap that currently exists in most organizations.

Research to Business

The Tests That Grade AI May Be Getting It Wrong

Stanford HAI

Stanford research reveals that AI benchmarks — the standardized tests used to rank models on safety, bias, and reasoning — often don't measure what they claim to. This has direct business implications: enterprises selecting AI models based on benchmark scores may be making purchasing decisions on unreliable data, and regulators building compliance requirements around these benchmarks may be building on sand.

Fed's Warsh Says AI Will Change Monetary Policy Conduct

Moomoo

Federal Reserve Governor Warsh stated that AI will fundamentally change how monetary policy is conducted, signaling that central banks are beginning to incorporate AI into macroeconomic decision-making. For financial services executives and investors, this means AI could alter interest rate forecasting, economic modeling, and the speed of policy responses.

AI Workforce Impact

Want Employees to Embrace AI? Stop Selling It as a Productivity Tool

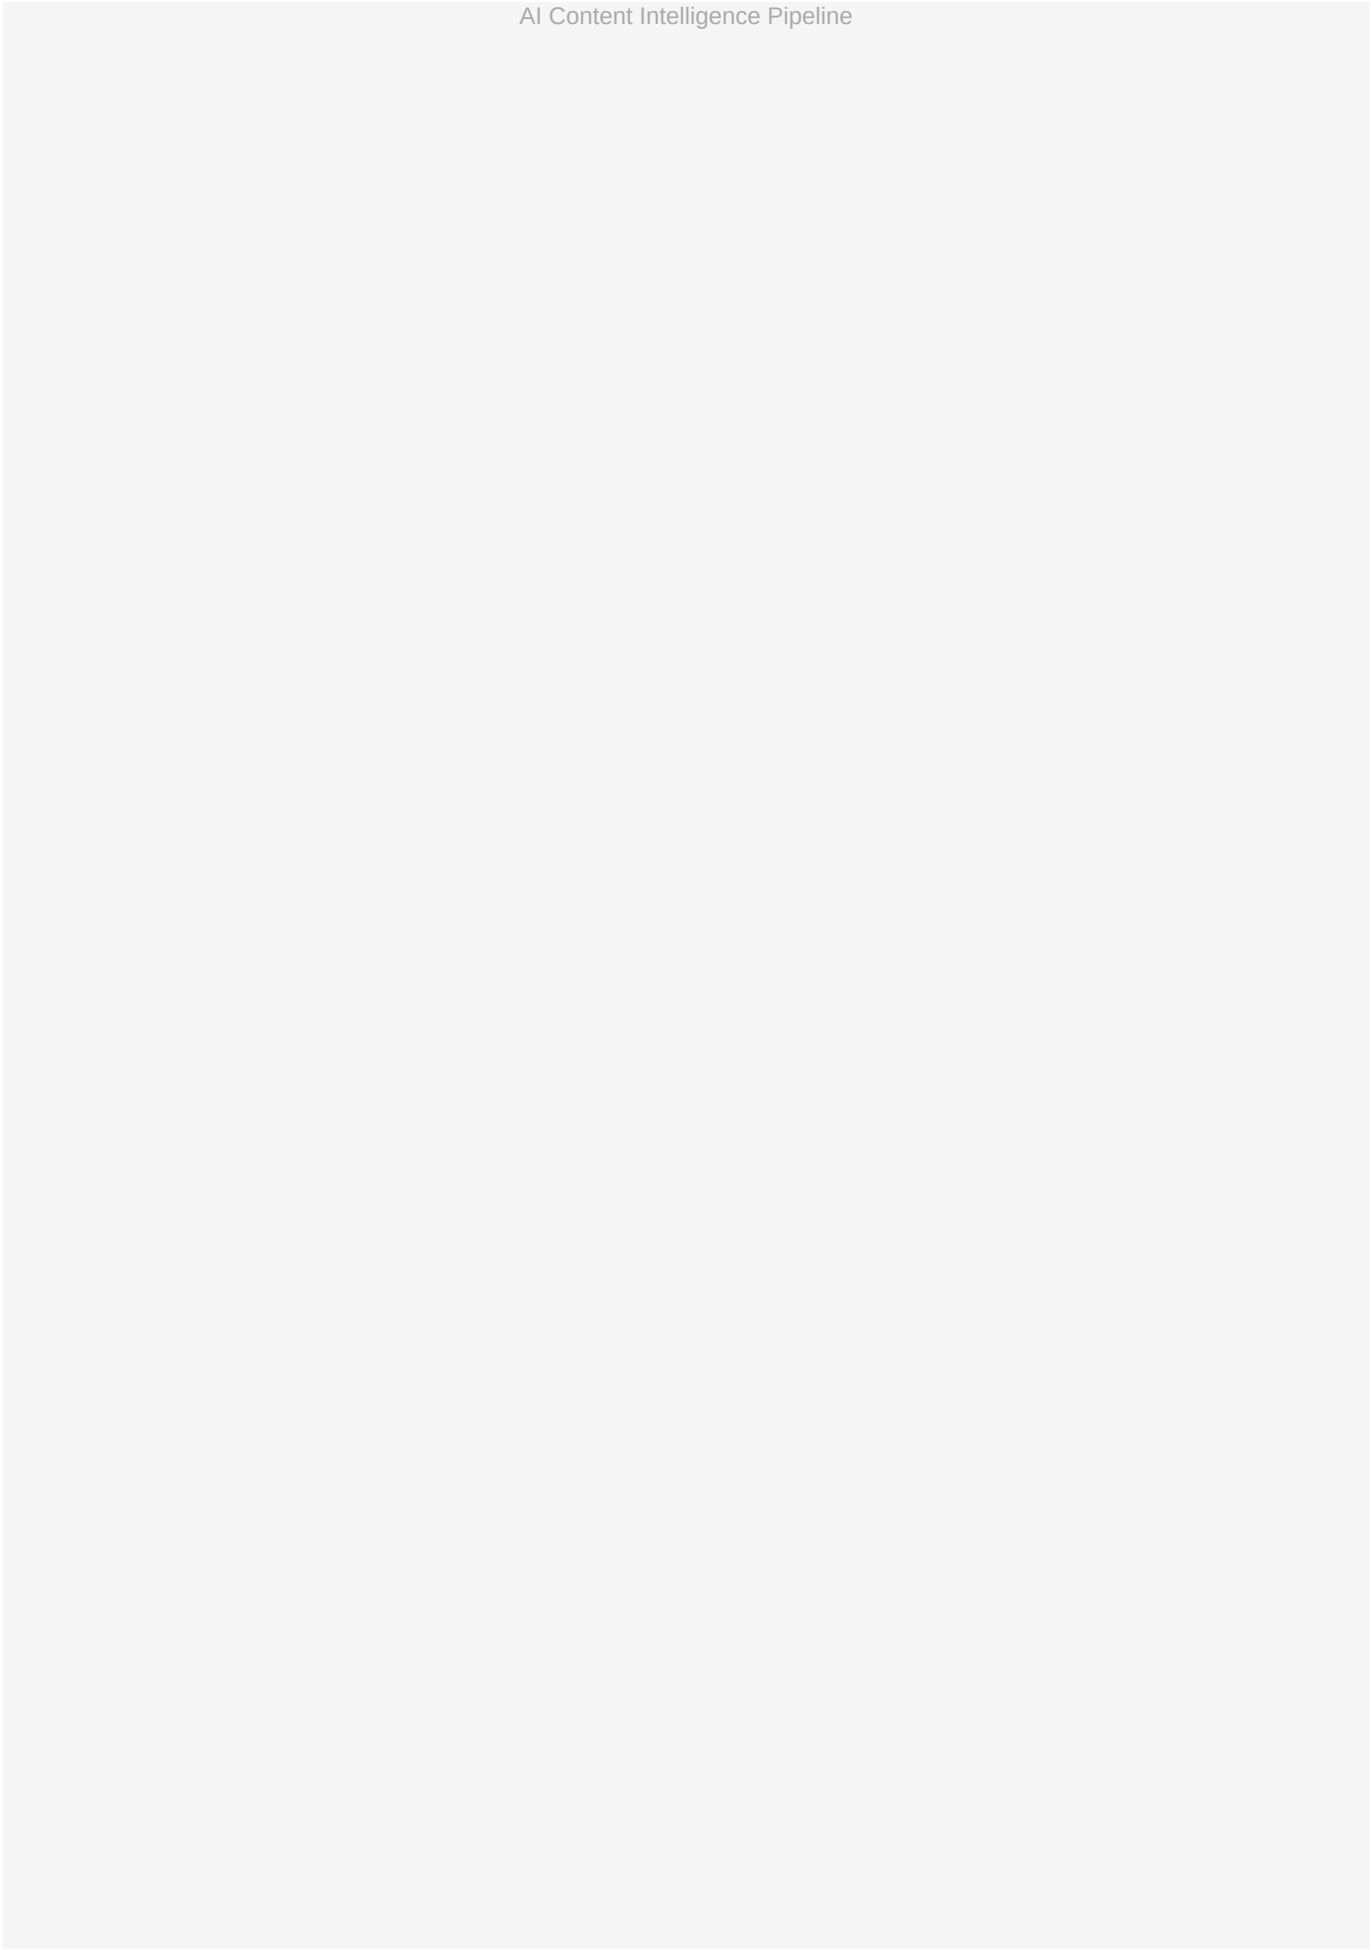

Stanford HAI

Stanford research finds that how managers frame and introduce AI to employees is a critical determinant of adoption success — and that pitching it purely as a productivity tool triggers resistance. Leaders should reframe AI as a capability enhancer rather than an efficiency play, a finding that has direct implications for change management strategies in enterprise AI rollouts.

Woman Arrested in Philadelphia for Blocking Delivery Robot

The Verge

A woman was arrested in Philadelphia for blocking an Uber delivery robot in protest of automation replacing human delivery workers, marking what may be one of the first arrests related to anti-automation civil disobedience. This incident signals growing public tension over AI and robotics displacing service workers, a dynamic that could escalate and create brand and regulatory risks for companies deploying autonomous delivery.
